```
produce 2 different mRNAs, one encoding a long form (bcl-XL), the other a short form (bcl-XS), lacking a stretch of 63 amino acids, by differential splicing of the 2nd coding exon to a more proximal 5'-splice donor within the 1st coding exon. Bcl-XS acts as a cominant negative regulator to bcl-XL activity, so it is preferable to use the bcl-XL cDNA for expression. The gene may be modified to facilitate interaction with costimulatory Bax protein and inhibit interaction with antagonistic Bad protein, by modification of the Bcl-2 homology domains BHI and/Or BHZ. The bcl-XL gene may be introduced into T-cells in vivo or ex vivo via gene transfer using introduced into T-cells in vivo or ex vivo wia gene transfer using a vector for HIV infection gene therapy, to augment intracellular bcl-XL protein levels and protect from cell death. A corresponding antisense oligonuclectide or expression vector may be used in gene therapy of e.g. autoimmune disease, graft rejection or graft.

Cherapy of e.g. autoimmune disease, graft rejection or graft.

Cherapy of e.g. autoimmune regulate the immune response in a T-lymphocyte population.

This DNA may be expressed recombinantly for the production of a BCL-X protein, particularly with pcwV plasmids as vectors for expression in mammalian cell cultures. The protein has particular application in cancer cells (failure of programed cell death (PCD))

New isolated human genes and the secreted polypeptide(s) they encode new isolated human genes and treatment of e.g. cencers, neurological useful for diagnosis and treatment of e.g. cencers, neurological disorders, immune diseases, inflammation or blood disorders at disorders immune diseases, inflammation or blood disorders as Claim i, Page 353-354; 721pp; English.

CC Cloudes a secreted human protein and Appendix as clone ATCC concerted human protein. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin cc protein as compared to the human protein only.

CC protein as compared to the human protein only.

CT protein as compared to the human protein only.

CT protein as compared to the human protein only.

Cacid sequences: V99511-V59812; anino acid sequences W74711-W75026) which are useful for preventing, treating or ameliorating medical conditions are useful for preventing, treating or ameliorating medical conditions can be diagnosed by determining the amount of the new polypeptides in a sample cor by determining the presence of mutations in the new polynucleotides.

CC Specific uses are described for each of the 186 polynucleotides, based on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 R 22-AuG-1997; US-056909.

protein associated with Bol-would levels of a Bol-w protein and/or protein associated with Bol-would as a derivative of the mouse Disclosure; Page 38: 52pp; English.

The present sequence is described as a derivative of the mouse bol-w gene (see X2513) and encodes Bol-w protein (see Y0553), a pro-survival member of the Bol-2 family which is widely expressed and which is essential for spermatogenesis. The invention relates generally to a method of treatment and to an animal model for the identification of molecules and genetic sequences useful for inducting or reducing fertility of male animals. Methods are provided for the treatment of infertility, or for reducing fertility, by modulating spermatogenesis. An animal model carries a mutation is at least one allele of the human or murine bol-w gene can inferous tubules and are substantially infertile, but possess no other major abnormalities as determined by histological examination. They can be used to screen for therapeutic molecules including genetic sequences capable of inducing, enhancing or otherwise facilities as facility, enhancing or otherwise facilities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ccgctgcaccaagccatgcgggcagctggagatgagttcgagacccgcttccggcgcacc 180

Claim 2; Fig 12A-12D; 12Opp; English.

This is the nucleotide sequence of the CDNA clone Bcl-like (HAICH29), used in the method of the invention. The products of the clone can be used for treating conditions associated with abnormal expression of the polypeptides. They can be used for e.g. treating chronic inflammatory diseases, immunological disorders, autoimmune diseases, inflammatory diseases, various allergies, and as anti-infectious agents. The products can also be used for detection and diagnosis. Sequence 1098 BP; 264 A; 279 C; 325 G; 230 T;
                                                                                                                                      20-NOV-1998 (first entry)
Nucleotide sequence of the cDNA clone Bcl-like (HAICH29).

This sequence encodes a novel gene, bcl-w, from the mouse bcl-2 gene family. This gene promotes cell survival, so its modulation is useful in treatment of cancer or auto-immune diseases, degenerative diseases (e.g. stroke, Alzheimer's disease, myocardial infarct, muscular degeneration, hypoxia, ischaemia, human immunodeficiency virus infection or in cell transplants. Up-regulation of the gene can also be used to modify cell lines cultured in vivo, e.g. to develop new lines, to facilitate isolation of hybridomas and to increase survival of primary explants during genetic modification. It can be used to produce recombinant Bcl-w modil brangy, diagnosis, antibody production or screening of potential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ttctctgatctggcggctcagctgcatgtgaccccaggctcagcccagcaacgcttcacc 240

For modulating programmed cell death

For modulating programmed cell death

Disclosure: Columns 13-16, 26pp; English.

The present sequence encodes rat bcl-y protein (Rbcl-y). The present sequence encodes rat bcl-y protein (Rbcl-y). The protein also describes human bcl-y protein (Rbcl-y). The protein also describes human bcl-y protein (Rbcl-y and Hbcl-y and Hbcl-y are homologues of the bcl-2 protein thought to be involved in comparing the programmed cell death (apptosals and necrosis). Rbcl-y and Hbcl-y and Hbcl-y proteins may be used to treat subjects suffering from: strokes, head trauma, cased in theraptes to treat subjects suffering from: strokes, head trauma, Alzheimer's Disease, neural and muscular degenerative diseases cell death, aping, spinal cord injuries and amyotrophic lateral cell sclerosis, which may not be apparent. They may also be cell death, aping, spinal cord injuries and amyotrophic lateral corditions where cells under go premature cell death as a customed period. In contrast, if they act as cell death stimulators, can extended period. In contrast, if they act as cell death stimulators, conditions associated with the conditions and auto/hyperimune diseases. They may also be used to cause cell death in, and hence control, parasites.

An animal model exhibiting reduced levels of a Bcl-w protein and/or protein associated with Bcl-w

Claim 3: Page 34: 52pp: English.

Claim 3: Page 34: 52pp: English.

The present sequence is the mouse bcl-w gene encoding Bcl-w protein seer 105531), a pro-survival member of the Bcl-2 family which is widely expressed and which is essential for spermatogenesis. The invention relates generally to a method of treatment and to an animal model for the identification of molecules and genetic animal model for the identification of molecules and genetic sequences useful for inducing or reducing fertility of male animals. Methods are provided for the treatment of infertility, or for reducing fertility, by modulating spermatogenesis. An animal model carries a mutation is at least one allele of the human or for reducing fertility, by modulating spermatogenesis. An animal model carries a mutation is at least one allele of the human or model carries a mutation is at least one allele of the human or the model carries and sension of the major abnormalities as determined infertile, but possess no other major abnormalities as determined the pastological examination. They can be used to screen for therapeutic molecules including genetic sequences capable of inducing, enhancing or otherawise facilitating spermatogenesis in animals, or which can induce infertility.
                                                                                                                                          Spermatogenesis; bcl-3 gene; Bcl-2; mouse; fertility; infertility;

Presents way 50.

Presents encodes the rat and human bcl-2 protein - useful for modulating programmed cell death bcl-y homologues of the rat and human bcl-y protein - useful for modulating programmed cell death bcl-y protein (Hbcl-y). The present sequence encodes human bcl-y protein (Rbcl-y). The present sequence encodes human bcl-y protein (Rbcl-y). Rbcl-y and hcl-y are homologues of the bcl-2 protein thought to be involved in programmed cell death (apoptosis and necrosis). Rbcl-y and Hbcl-y proteins may be used to treat conditions associated with a disruption of the cell death pathway. If they act as cell death inhibitors, they may be used in theraples to treat subjects suffering from: strokes, head trauma, alzehimer's Disease, neural and muscular degenerative diseases (especially multiple sclerosis), myocardial infarction, vitally induced cell death, aging, spinal cord injuries and amyotrophic lateral as celerosis-conditions where cells under go premature cell death as a result of triggers which may or may not be apparent. They may also be used to trias way to develop cell lines which remain viable in culture for used in this way to develop cell lines which remain viable in culture for used in this way to develop cell lines which remain viable in culture for the extended period. In contrast, if they act as cell death stimulators, Rbcl-y and Hbcl-y may be used to treat conditions associated with prolonged cell life span such as cancer (especially kaposi's sarcoma and cause cell death in, and hence control, pareastes.

The mammalian bcl.y genes encode a protein that is a member of the bcl.2 family, components in the cell death pathway. The bcl.2 family have both apoptoric activity and the apoptosis blocking activity. bcl.y falls in the apoptosis activity category. The recombinant protein may be used to prevent uncontrolled cell growth, either by its direct administration to recombinant genetic constructs to increase its expression in vivo. Also, antisense constructs can be used in disorders where prevention of cell death is desired.

Claim 3; Column 15/16; 27pp; English.
The mammanlan bcl-y genes encode a protein that is a member of the bcl-2 family, components in the cell death pathway. The bcl-2 family have both apoptotic activity and the apoptosis blocking activity. bcl-y
                                                                                                                                                               falls in the apoptosis activity category. The recombinant protein may administration to recombinant genetic constructs to increase its expression in vivo. Also, antisense constructs can be used in disorders where prevention of cell death is desired.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 540

An animal model exhibiting reduced levels of a Bcl-w protein and/or protein associated with Bcl-w

Disclosure; Page 36; 52pp; English.

The present sequence is described as a derivative of the human present sequence is described as a derivative of the human pro-survival member of the Bcl-2 family which is widely expressed and which is essential for spermatogenesis. The invention relates generally to a method of treatment and to an animal model for the identification of molecules and genetic sequences useful for inducing or reducing fertility of male animals. Methods are provided for the treatment of infertility, or for reducing certility, by modulating spermatogenesis. An animal model carries a mutation is at least one allele of the human or mutine bol-w gene cor in a gene associated with bol-w. Such animals have disorganised seminferous tubules and are substantially infertile, but possess no other major abnormalities as determined by histological examination.
                                                                                                                                                                                                   480

Problem 1000 and a sociated with Bcl-w protein and/or protein associated with Bcl-w protein associated with Bcl-w claim 3; Page 31; 52pp; English.

Sclaim 3; Page 31; 52pp; English.

Claim 3; Page 31; 52pp; English.

The present sequence is the human bcl-w gene encoding Bcl-w protein (see Y0530), a pro-survival member of the Bcl-2 family which is undely expressed and which is essential for spermatogenesis. The invention relates generally to a method of treatment and to an animal model for the identification of molecules and genetic sequences useful for inducing or reducing fertility of male sequences useful for inducing or reducing fertility, or for reducing fertility, by modulating spermatogenesis. An animal model carries a mutation is at least one allele of the human or murine bcl-w gene or in a gene associated with bcl-w. Such animals inferring the possess no other major abnormalities as determined by histological examination. They can be used to screen for therapeutic molecules including genetic sequences capable of 480 480 481 ogtctgogggagggaactgggcatcagtgaggacagtgctgacgggggccgtggcactg 540 540 301 ctctttggggctgcactgtgtgctgagagtgtcaacaaggagatggaaccactggtggga 360 420 181 ttctctgatctggcggctcagctgcatgtgaccccaggctcagcccagcaacgcttcacc 240 121 ccgctgcaccaagccatgcgggcagctggagatgagttcgagacccgcttccggcgcacc 180 121 CCGCTGCACCAAGCCATGCGGGCAGCTGGAGATGAGTTCGAGACCCGCTTCCGGCGCACC 180 181 Incrementation of the content of 241 caggictecgaegaactititeaagggggeeceaactggggeegeetigiageettetit 300 1 ATGGCGACCCCAGCCTCGGCCCCAGACACACGGGCTCTGGTGGCAGACTTTGTAGGTTAT 60 Spermatogenesis; bcl-3 gene; Bcl-2; human; fertility; infertility; 421 agtgggggctgggcggagttcacagctctatacggggacgggggccctggaggaggcgcgg 421 AGTGGGGGCTGGGCGGAGTTCACAGCTCTATACGGGGACGGGGCCCTGGAGGAGGCGCGG 481 CGTCTGCGGGAGGGGAACTGGGCATCAGTGAGGACAGTGCTGACGGGGGCCGTGGCACTG 541 ggggccctggtaactgtaggggccttttttgctagcaagtgaa 583 25-MAR-1999.

ALIGNMENTS

```
cc dominant negative regulator to bcl-XL activity, so it is preferable cc to use the bcl-XL cDNA for expression. The gene may be modified to capital activity may protein and inhibit cinteraction with antagonistic Bad protein, by modification of the contraction with antagonistic Bad protein, by modification of the Bcl-2 homology domains BH1 and/or BH2. The bcl-XL gene may be introduced into T-cells in vivo or ex vivo via gene transfer using a vector for HIV infection gene therapy, to augment intracellular cbcl-XL protein levels and protect from cell death. A corresponding antisense oligonucleotide or expression vector may be used in gene cc therapy of e.g. autoimmune disease, graft rejection or graft. C versus-host disease, to induce cell death (e.g. apoptosis) and cown-regulate the immune response in a T-lymphocyte population. Sequence 926 BP; 220 A; 249 C; 264 G; 193 T;

PR New apoptosis-resistant virus-sensitive cell

PR Scample 2; Page 41-45; 51pp; English.

CC The present invention describes an apoptosis-resistant virus-sensitive cell line into which an apoptosis resistance gene has been introduced.

CC The recombinant viruses generated are capable of expressing apoptosis-cc cell line into which an apoptosis resistance gene has been introduced.

CC The recombinant viruses generated are capable of expressing apoptosis-cc associated genes. These can then be used in a variety of diseases for
```

```
which the induction of apoptosis by gene transfer, or where the inhibition of harmful apoptosis, is therapeutic. The recombinant viruses are useful as vectors for gene therapy which can be applied to cancer therapy for destroying cancer cells selectively, the treatment of autoimmune diseases and graft rejection reaction, and apoptosis induction therapy for inflammatory cells in inflammatory diseases. Prior arts have concountered the problem where if an adenovirus vector capable of expressing an apoptosis-associated gene is introduced into animal cells, the cells producing the virus will be destroyed because the period of time required to induce cell death by apoptosis is shorter than that required to replicate and produce the virus, resulting in failure to obtain a recombinant virus having the integrated apoptosis-associated contain a recombinant gene introduced) is established and overcomes the apoptosis resistant gene introduced) is established and overcomes the problem. The present sequence represents the base sequence of the problem. The present sequence represents the human Bcl-xl gene, and sequence 7372 BB; 2353 A; 1749 C; 1649 G; 1621 T;

This DNA may be expressed recombinantly for the production of a BCL-X protein, particularly with pcwV plasmids as vectors for expression in mammalian cell cultures. The protein has particular application in cancer cells (failure of programed cell death (PCD))

This sequence encodes human bcl.*ZL protein, which protects
T-lymphocytes against cell death. The genomic bcl.*X gene may produce 2 different mRNAs, one encoding a long form (bcl.*XL), the protein a short form (bcl.*XS), lacking a stretch of 63 amino acids, by differential splicing of the 2nd coding exon to a more proximal 5'-splice donor within the 1st coding exon. Bcl.*XS acts as a

Per Vision Washington and the secreted polypeptide(s) they encode useful for diagnosis and treatment of e.g. cancers, neurological elso disorders, immune diseases, inflammation or blood disorders claim 1; Page 153-154; 721pp; English.

This sequence represents a nucleic acid molecule designated Gene 120 from the human cDNA clone HGBGZ64 (deposited as clone ATCC 97902 and ATCC 209048) which encodes a secreted human protein. The gene can be used to pereste fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. V59502) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 186 novel genes and their fragments (nucleic are useful for preventing, treating or ameliorating medical conditions are useful for preventing, treating or ameliorating medical conditions are useful for preventing the amount of the new polypeptides in a sample or by determining the amount of the new polypeptides in a sample or becific uses are described for each of the 186 polynucleotides, based on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (HUMA-) HUMAN GENOME SCI INC.

The present sequence encodes human bc1-y protein (Hbc1-y). The sequence encodes human bc1-y protein (Rbc1-y). Rbc1-y and Hbc1-y are homologues of the bc1-y protein (Rbc1-y). Rbc1-y and Hbc1-y are homologues of the bc1-y protein (Rbc1-y). Rbc1-y and Hbc1-y are homologues of the bc1-y protein thought to be involved in proteins may be used to treat conditions associated with a disruption of the cell death pathway. If they act as cell death inhibitors, they may be used in theraples to treat subjects suffering from: strokes, head trauma, alzewimer's Disease, neural and muscular degenerative diseases (especially multiple sclerosis), myocardial infarction, vitally induced cell death, aging, spinal cord injuries and amyotrophic lateral sclerosis- conditions where cells under go premature cell death as a result of triggers which may or may not be apparent. They may also be used in this way to develop cell lines which remain viable in culture for an extended period. In contrast, if they act as cell death with the span such as cancer (especially kaposi's sarcoma and prolonged cell life span such as cancer (especially kaposi's sarcoma and angered cancer) death at they may also be used to angered continue diseases. They may also be used to anger cancer chept may also be used to anger cancer) death and auto/hyperinumune diseases. They may also be used to anger cancer cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 480

the polypeptides. They can be used for e.g. treating chronic inflammatory diseases, immunological disorders, autoimmune diseases, inflammatory diseases, various allergies, and as anti-infectious agents. The products can also be used to detection and diagnosis. Sequence 1098 BP; 264 A; 279 C; 325 G; 230 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     þe

Rat bcl-y protein; Rbcl-y; human bcl-y protein; Hbcl-y; bcl-2 homologue; programmed cell death; apoptosis; necrosis; cell death inhibitor; stroke; head trauma; Alzheimer's bisease; neural; muscular degenerative disease; multiple sclerosis; myocardial infarction; vitally induced cell death; aging; spinal cord injury; amyotrophic lateral sclerosis; cancer; premature cell death; cell death stimulator; prolonged cell life span; Raposi's sarcoma; lung cancer; autoimmune; hyperimmune disease;
have both apoptotic activity and the apoptosis blocking activity. bcl-y falls in the apoptosis activity category. The recombinant protein may be used to prevent uncontrolled cell growth, either by its direct administration to recombinant genetic constructs to increase its expression in vivo. Also, antisense constructs can be used in disorders where prevention of cell death is desired.

auto-immune diseases, degenerative diseases (e.g. stroke, Alzheimer's disease, myocardial infarct, muscular degeneration, hypoxia, ischaemia, human immunodeficiency virus infection or in cell transplants. Up-regulation of the gene can also be used to modify cell lines cultured in vivo, e.g. to develop new lines, to facilitate isolation of hybridomas and to increase survival of primary explants during genetic modification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 3; Page 48; 86pp; English.
This sequence encodes a novel human gene, bcl-w, from the bcl-2 gene family, extracted from an adult brain library. This gene promotes cell survival, so its modulation is useful in treatment of cancer or

An animal model exhibiting reduced levels of a Bcl-w protein and/or protein associated with Bcl-w

Brotein associated with Bcl-w

Bisclosure; Page 36; 52pp; English.

Crep present sequence is described as a derivative of the human bisclosure; Page 36; 52pp; English.

Crep present sequence is described as a derivative of the human crep are x25l12) and encodes Bcl-w protein (see Y05512), a pro-survival member of the Bcl-2 family which is widely expressed and which is essential for spermatogenesis. The invention relates generally to a method of treatment and to an animal model for the inducing or reducing fertility of male animals. Methods are provided for the treatment of infertility, or for reducing fertility of male animals. Methods are convoluted for the treatment of infertility, or for reducing fertility as modulating spermatogenesis. An animal model carries a mutation is at least one allele of the human or murine bcl-w gene con in a gene associated with bcl-w. Such animals have disorganised seminferous tubules and are substantially infertile, but possess no other major abnormalities as determined by histological examination.

They can be used to screen for therapeutic molecules including
                                                                                                                                                                                                                                                                                                                                                                                                      540

Disclosure, Collumns 13-16; 26pp; English.

The present sequence encodes rat Del-y protein (HDCl-y). Rbcl-y and Broch encodes rat bel-y protein (HDCl-y). Rbcl-y and Encodes rat bel-y protein thought to be involved in their programmed cell death (apoptosis and necrosis). Rbcl-y and HBCl-y proteins may be used to treat conditions associated with a disruption of proteins may be used to treat conditions associated with a disruption of the cell death pathway. If they act as cell death inhibitors, they may be used in therapies to treat subjects suffering from: strokes, head trauma, seed in therapies to treat subjects suffering from: strokes, head trauma, and the sclerosis, may or act as cell death, as a caperosially multiple sclerosis, myocardial infarction, vitally induced cell death, aging, spinal cord injuries and amyotrophic lateral cell death, aging spinal cord injuries and amyotrophic lateral sclerosis. Conditions where cells under go premature cell death as a sclerosis or conditions where cells under your perparent. They may also be used in this way to develop cell lines which remain viable in culture for used in this way to develop cell lines which remain viable in culture for used in this way to develop cell lines which remain viable in culture for used in this way to develop cell lines with a cancer (especially kaposi's sarcoma and prolonged cell life span such as cancer (especially kaposi's sarcoma and lung cancer) and auto/hyperimmune diseases. They may also be used to cause cell death in, and hence control, may also be used to cause cell death in, and hence control, they may also be used to cause cell death in, and hence control, they may also be used to cause cell death in, and hence control, they may also be used to cause cell death in, and hence control, they may also be used to cause cell death in, and hence control, they may also be used to cause cell death in, and hence control protein the may be used to the manner o

Claim 3: Page 32: 52pp; English.

The present sequence is the human bcl-w gene encoding Bcl-w protein

The present sequence is the human bcl-w gene encoding Bcl-w protein

(see Y0530), a pro-survival member of the Bcl-2 family which is

widely expressed and which is essential for spermatogenesis. The

invention relates generally to a method of treatment and to an

inmal model for the identification of molecules and genetic

capuences useful for inducing or reducing fertility of male

sequences useful for inducing or reducing fertility, or

animals. Methods are provided for the treatment of infertility, or

animals. Methods are provided for the sequences is. An animal

model carries a mutation is at least one allele of the human or

mutine bcl-w gene or in a gene associated with bcl-w. Such animals

infertile, but possess no other major abnormalities as determined

infertile, but possess no other major abnormalities as determined

therapeutic molecules including genetic sequences capable of

therapeutic molecules including genetic sequences capable of

inducing, enhancing or otherwise facilitating spermatogenesis in

canimals, or which can induce infertility.

                                         Nucleic acids encoding B-cell lymphoma-y protein - useful for producing recombinant protein for use in treating uncontrolled cell producing recombinant protein for use in treating uncontrolled cell growth e.g. cancers
Claim 2: Column 13/14; 27pp; English.

The mammalian bcl.y genes encode a protein that is a member of the bcl-2 family.

The mammalian bcl.y genes encode a protein that is a member of the bcl-2 family have both apoptotic activity and the apoptosis blocking activity. bcl-y falls in the apoptosis activity category. The recombinant protein may administration to recombinant genetic constructs to increase its expression in vivo. Also, antisense constructs can be used in disorders sequence 579 BP; 111 A; 157 C; 198 G; 113 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cDNA encoding the rat bc1-y protein.

The present sequence is described as a derivative of the mouse color-way gene (see x2513) and encodes Bcl-w protein (see Y05533), a pro-survival member of the Bcl-2 family which is widely expressed and which is essential for spermatogenesis. The invention relates contentification of molecules and generic sequences useful for inducing or reducing fertility of male animals. Methods are inducing or reducing fertility of male animals. Methods are provided for the treatment of infertility, or for reducing fertility, by modulating spermatogenesis. An animal model carries a mutation is at least one allele of the human or murine bcl-w gene cor in a gene associated with bcl-w. Such animals have disorganised seminferous tubules and are substantially infertile, but possess no other major abnormalities as determined by histological examination. They can be used to screen for therapeutic molecules including

                                                       The present sequence is the mouse bcl-w gene encoding Bcl-w protein (see Y05531), a pro-survival member of the Bcl-2 family which is widely expressed and which is essential for spermatogenesis. The invention relates generally to a method of treatment and to an animal model for the identification of molecules and genetic sequences useful for inducing or reducing fertility of male animals. Methods are provided for the treatment of infertility, or for reducing fertility, by modulating spermatogenesis. An animal model carries a mutation is at least one allele of the human or murine bcl-w gene or in a gene associated with bcl-w. Such animals

Claim 3; Page 50-51; 86pp; English.

This sequence encodes a novel gene, bcl-w, from the mouse bcl-2 gene family. This gene promotes cell survival, so its modulation is useful in treatment of cancer or auto-immune diseases, degenerative diseases (e.g. stroke, Alzheiner's disease, myocardial infarct, muscular degeneration, hypoxia, ischaemia, human immunodeficiency virus infection or in cell transplants. Up-regulation of the gene can also be used to modify cell lines cultured in vivo, e.g. to develop new lines, to facilitate isolation of hybridomas and to increase survival of primary explants furing genetic modification. It can be used to produce recombinant Bcl-w for therapy, diagnosis, antibody production or screening of potential modulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 atgccgaccccagcctcaaccccagacacacgcgctctagtgggctgactttgtaggctat 60

T-lymphocytes against cell death. A splice variant form, bol-xs, lacks a stretch of 63 amino acids, and is a dominant negative regulator of bcl-XL function. The gene may be modified to facilitate interaction with costimulatory Bax protein and inhibit interaction with antagonistic Bad protein, by modification of the Bcl-2 homology domains BH1 and/or BH2. The bcl-XL gene may be ector for HIV infection gene therapy, to augment intracellular a vector for HIV infection gene therapy, to augment intracellular bcl-XL protein levels and protect from cell death. A corresponding antisense oligonucleotide or expression vector may be used in gene therapy of e.g. autoimmune disease, graft rejection or graftversus-host disease, to induce cell death (e.g. apoptosis) and
                                                                                                                                                                                                                                    Inducing or preventing death of T cells by bcl-XL protein regulation used to increase survival of HIV infected cells or to down:regulate immune responses in immune diseases Disclosure; Page 52-53; 76pp; English.

This is the sequence of a human bcl-XL protein, which protects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diséases (premature PCD), e.g. Parkinson's disease, amylotrophic

claim 6; Page 50-51; B6pp; English.
This sequence represents a novel protein, bcl-w, encoded by the mouse bcl-2 gene family. This gene promotes cell survival, so its modulation is useful in treatment of cancer or auto-immune diseases, degenerative diseases (e.g. stroke, Alzheimer's disease, myocardial infarct, muscular degeneration, hypoxia, ischaemia, human immunodeficiency virus infection or in cell transplants. Up-regulation of the gene can also be used to modify cell lines cultured in vivo, e.g. to develop new lines, to facilitate isolation of hybridomas and to increase survival of primary recombinant Bcl-w for therapy, diagnosis, antibody production or screening of potential modulators.

            substantially infertile, but possess no other major abnormalities as determined by histological examination. They can be used to screen for therapeutic molecules including genetic sequences capable of inducing, enhancing or otherwise facilitating spermatogenesis in animals, or which can induce infertility. Claim 1; Fig 12A-12D; 120pp; English.

This is the amino acid sequence of the CDNA clone Bcl-like (HAICH29), used in the method of the invention. The products of the clone can be used for treating conditions associated with abnormal expression of the polypeptides. They can be used for e.g. treating chronic inflammatory diseases, immunological disorders, autoimmune diseases, inflammatory alseases, various allergies, and as anti-infectious agents. The products can also be used for detection and diagnosis.

For modulating programmed cell death

Claim 2: Columns 19-22: 26pp: English.

Claim 2: Columns 19-22: 26pp: English.

The present sequence represents a mammalian bcy-1 protein.

The specification describes rat bcl-y protein (Rbcl-y) and human bcl-y

protein (Hbcl-y). Rbcl-y and Hbcl-y are homologues of the bcl-2 protein

thought to be involved in programmed cell death (apoptosis and necrosis).

Rbcl-y and Hbcl-y proteins may be used to treat conditions associated

with a disruption of the cell death pathway. If they act as cell death

inflators, they may be used in therapies to treat subjects suffering

from: strokes, head trauma, Alzheimer's Disease, neural and muscular

degenerative diseases (especially multiple sclerosis), myocardial

infarction, vitally induced cell death, aging, spinal cord injuries and

amyotrophic lateral sclerosis- conditions where cells under go premature

cell death as a result of triggers which may or may not be apparent.

They may also be used in this way to develop cell lines which remain

viable in culture for an extended period. In contrast, if they act as

cell death stimulators, Rbcl-y and Hbcl-y may be used to treat

conditions associated with prolonged cell life span such as cancer

conditions associated with prolonged cell life span such as cancer

conditions associated with prolonged cell life span such as cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Projectin sequence of the specification.

for modulating programmed cell death

Disclosure; Columns 19-20; 26pp; English.

The specification describes rat bcl-y protein (Rbcl-y) and human bcl-y
protein (Hbcl-y). Rbcl-y and Hbcl-y protein (apoptosis and necrosis).

CC The specification describes rat bcl-y protein (apoptosis and necrosis).

CC Rbcl-y and Hbcl-y proteins may be used to treat conditions associated
with a disruption of the cell death pathway. If they act as cell death
conditions they may be used in therapies to treat subjects suffering
inhibitors, they may be used in therapies to treat subjects suffering
from: strokes, head trauma, Alzheimer's biseases, neural and muscular
degenerative diseases (especially multiple sclerosis), myocardial
infarction, vitally induced cell death, aging, spinal cord injuries and
amyotrophic lateral sclerosis- conditions where cells under go premature
cell death as a result of triggers which may or may not be apparent.
They may also be used in this way to develop cell lines which remain
viable in culture for an extended period. In contrast, if they act as
cell death stimulators, Rbcl-y and Hbcl-y may be used to treat
conditions associated with prolonged cell life span such as cancer
diseases. They may also be used to cause cell death in, and hence
diseases. They may also be used to cause cell death in, and hence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 protein associated with Bcl.w

The present sequence is described of a derivative of mouse Bcl-w
(see also 905531), a pro-survival member of the Bcl-2 family that
is widely expressed and which is essential for spermatogenesis.

The derivative lacks the 24 N-terminal amino acids of Bcl-w.

The invention relates generally to a method of treatment and to an
animal model for the identification of molecules and genetic
sequences useful for inducing or reducing fertility, or for
Rethods are provided for the treatment of infertility, or for
reducing fertility, by modulating spermatogenesis. An animal model
carries a mutation is at least one allele of the human or murine
bcl-w gene (see X25132-35) or in a gene associated with bcl-w.

The present sequence represents rat bcl-y protein (Rbcl-y). Rbcl-y and also describes human bcl-y protein (Bbcl-y). Rbcl-y and Bbcl-y protein may be used to treat conditions associated with a disruption of the cell death pathway. If they act as cell death inhibitors, they may be used in therapies to treat subjects suffering from: strokes, head trauma, cused in therapies to treat subjects suffering from: strokes, head trauma, Alzheimer's Disease, neural and muscular degenerative diseases

CC cell death, aging, spinal cord injuries and amyotrophic lateral

CC cell death, aging, spinal cord injuries and amyotrophic lateral

CC conditions where cells under go premature cell death as a

CC sclerosis- conditions where cells under go premature cell death as a

CC an extended period. In contrast, if they act as cell death stimulators,

CC sclerosis- and auto/hyperimmune diseases. They may also be used to

CC cause cell death in, and hence control, parasites.
                                                                                                                                                                                         The rat bol.y protein.

The rat bol.y protein. Rbol.y; human bol.y protein; Hbol.y; bol.2 homologue; Rat bol.y protein. Rbol.y; human bol.y protein; Bol.y; head death; apoptosis; necrosis; cell death inhibitor; stroke; head trauma; Alzheimer; bisase; neural; muscular degenerative disease; multiple sclerosis; myocardial infarction; vitally induced cell death; aging; spinal cord injury; amyotrophic lateral sclerosis; cancer; premature cell death; cell death stimulator; prolonged cell life span; Raposi's sarcoma; lung cancer; autoimmune; hyperimmune disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The bol-2 family have both apoptotic activity and the apoptosis blocking activity. bol-y falls in the apoptosis activity. The recombinant protein may be used to prevent uncontrolled cell growth, either by its direct administration to recombinant genetic constructs to increase its expression in vivo. Also, antisense constructs can be used in disorders where prevention of cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

growth e.g. cancers

Example, Column 17/18; 27pp; English.

The mammalian bcl-y protein is a member of the bcl-2 family, components in the cell death pathway. The bcl-2 family have both apoptotic activity and the apoptosis blocking activity. bcl-y falls in the apoptosis and the apoptosis blocking activity. bcl-y falls in the apoptosis artivity category. The recombinant protein may be used to prevent uncontrolled cell growth, either by its direct administration to recombinant genetic constructs to increase its expression in vivo. Also, antisense constructs can be used in disorders where prevention of cell
                                                                                                                                                                                                                                                                                                             ó

                                                                                                                                                                                                                                                                                                                                                                    fertility of male animals. Methods are provided for the treatment of infertility, or for reducing fertility, by modulating spermatogenesis. An animal model carries a mutation is at least one allele of the human or murine bcl-w gene (see X25132-35) or in a gene associated with bcl-w. Such animals have disorganised seminferous tubules and are substantially infertile, but possess no other major abnormalities as determined by histological examination. They can be used to screen for therapeutic molecules including genetic sequences capable of inducing, enhancing or otherwise facilitating spermatogenesis in animals, or which can induce

The modulating programmed cell death number DCI-z protein - userial per Claim 1; Columns 17-18; 26pp; English.

Claim 1; Columns 17-18; 26pp; English.

The present sequence represents human bcl-y protein (Hbcl-y). The specification also describes rat bcl-y protein (Rbcl-y). Rbcl-y and Hbcl-y are homologues of the bcl-2 protein thought to be involved in proteins may be used to treat conditions associated with a disruption of proteins may be used to treat conditions associated with a disruption of the cell death pathway. If they act as cell death inhibitors, they may be used in therapies to treat subjects suffering from: strokes, head trauma, closed in therapies to treat subjects suffering from: strokes, head trauma, closed in therapies to disperse, neural and muscular degenerative diseases (especially multiple sclerosis), mayocardial infarction, vitally induced cell death, aging, spinal cord injuries and amyotrophic lateral collings where cells under go premature cell death as a result of triggers which may or may not be apparent. They may also be used in this way to develop cell lines which remain viable in culture for the cell death as a cell death as cell death as a cell death as cell de
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The human bcl.y protein.

The human bcl.y protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Rbcl-y and Hbcl-y may be used to treat conditions associated with prolonged cell life span such as cancer (especially kaposi's sarcoma and lung cancer) and auto/hyperimmune diseases. They may also be used to cause cell death in, and hence control, parasites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô

or inhibit cell survival, e.g. for treatment of cancer and degenerative diseases.

Claim 6; Page 48; B6pp; English.

This sequence represents a novel human protein, bcl-w, encoded by the cancer or auto-immune diseases, degenerative diseases (e.g. stroke, promotes cell survival, so its modulation is useful in treatment of cancer or auto-immune diseases, degenerative diseases (e.g. stroke, schaemia, human immunodeficiency virus infection or in cell transplants. Up-regulation of the gene can also be used to modify cell lines cultured in vivo, e.g. to develop new lines, to facilitate isolation of hybridomas and to increase survival of primary explants during genetic modification.

It can be used to produce recombinant Bcl-w for therapy, diagnosis, antibody production or screening of potential modulators.

The natural model exhibiting reduced levels of a Bcl-w protein and/or protein associated with Bcl-w

25 Claim 27. Page 33.52pp. English.

The present sequence is human Bcl-w, a pro-survival member of the Bcl-2 family which is widely expressed and which is essential for spermatogenesis. The invention relates generally to a method of treatment and to an animal model for the identification of molecules and genetic sequences useful for inducing or reducing for fartility of male animals. Methods are provided for the treatment.

26 fartility of male animals. Methods are provided for the treatment.

27 of infertility, or for reducing fertility, by modulating spermatogenesis. An animal model carries a mutation is at least of a pen associated with bcl-w. Such animals have disorganised seminferous tubules and are substantially infertile, but possess no cher major abnormalities as determined by histotogical examination. They can be used to screen for therapeutic molecules including genetic sequences capable of inducing, enhancing or otherwise in animals, or which can induce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 FSDLAAQLHVTPGSAQQRFTQVSDELFQGGPNWGRLVAFFLFGAALCAESVNKEMEDLVG 120

Claim 2; Page 35; 52pp; English.
The present sequence is mouse Bcl-w, a pro-survival member of the
Bcl-2 family which is widely expressed and which is essential for
spermatogenesis. The invention relates generally to a method of
treatment and to an animal model for the identification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  05-JUL-1999 (first entry)
Mouse Bcl-w protein essential for spermatogenesis.
Spermatogenesis; Bcl-3; Bcl-2; mouse; fertility; infertility;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length 193;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1; Indels

Mean 32.637; Variance 140.214; scale 0.233 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
